# What is the status of George Washington Memorial Parkway natural resources? 

Water Quality Generally, water quality is good. Several indicators, including pH and dissolved oxygen, score as very good or good. Benthic communities are degraded and stream habitat is moderately good. Management to improve stream habitats should be considered.

Landscape Dynamics Overall, landscape dynamics are in moderately good condition. Impervious surface scores well. The forest cover score is good. Interior forest area forms the core forest habitat and is very degraded. Forest condition needs continued management focus.

Biotic integrity Biotic Integrity is degraded. Seedling stocking index is very degraded. Deer density scores an F. Deer depress seedling numbers. Continued management of deer is needed.

## What do the scores tell us?

These scores provide a snapshot of resource condition based primarily on Inventory and Monitoring (I\&M) data. It is important to track resource condition even if resources are difficult to manage. Resource conditions at the park and landscape level can be used to guide management strategies.

## How is natural resource condition assessed?

The status of each indicator is monitored within National Capital region (NCR) parks. A target threshold for the indicator is based on scientific peer-reviewed literature and/or consensus. We compare each natural resource condition to the target threshold value and assign a score. Indicators may be measured as a pass/fail score, as with deer density; on a graduated scale, as with the Bird Community Index; or may be the actual value of the data, as with interior forest area. For more detailed information on how scores are calculated, please see the RAMS methods document (currently in progress).

## Monitoring protocols vary among indicators

The frequency and time of year sampled varies by indicator and category. Most Water Quality indicators are sampled monthly at multiple sampling locations within the park. Physical habitat and benthic communities are sampled less frequently at multiple sites. Many biotic integrity data are collected in rotating subsets of total plots each year, with each plot sampled once every four years. Birds are sampled at different locations, and deer density may be calculated from surveys. Air quality data are collected continuously by the Air Resources Division at monitoring sites within or near parks. Landscape dynamics data are from a national GIS database showing classes of land cover.

Monitoring helps park managers understand and assess resource condition. Photos clockwise from left: Erythronium albidum, Hairstreak Olive on Pycnanthemum, Bluebells at Turkey Run Park, Dragonfly.

## Air Quality monitoring and thresholds

Air Quality reference condition table

| Metric | Reference condition |  |  | Park average | Overall score (\%) | Condition |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Particulate matter (PM2.5 $\mu \mathrm{g} / \mathrm{m}^{3}$ ) |  | $\frac{\text { PM2.5 } \mathrm{g} / \mathrm{m}^{3}}{\text { score }}$ | $\begin{array}{r} 54 \\ \quad 100 \% \end{array}$ | 43.00 | 100\% | Very good |
| (N) $\begin{aligned} & \text { Nitrogen } \\ & (\mathrm{kg} / \mathrm{ha} / \mathrm{yr})\end{aligned}$ | 3 | $\mathrm{kg} / \mathrm{ha} / \mathrm{yr}$ score | $\begin{array}{r} 1 \\ 100 \% \end{array}$ | 3.50 | 0\% | Very degraded |
| SO ${ }_{4}$ Sulfur (kg/ha/yr) |  | $\begin{gathered} \text { kg/ha/yr } \\ \text { score } \end{gathered}$ | $\stackrel{1}{100 \%}$ | 1.50 | 75\% | Good |
| Visibility (Haze index) |  | $\begin{aligned} & \text { Haze index } \\ & \text { score } \end{aligned}$ | $\begin{array}{r} 2 \\ 100 \% \end{array}$ | 13.40 | 3\% | Very degraded |
| Ozone <br> (W126m ppm-hrs) |  | W126m ppm-hrs score | $\begin{array}{r} 7 \\ 100 \% \end{array}$ | 8.70 | 72\% | Good |
| Air Quality overall co | tion |  |  |  | 50\% | $\bigcirc$ Moderate |

Particulate matter (PM) is composed of extremely small droplets and solid particles suspended in air. PM is found in smoke, haze, and dust. It is not measured in every park.

Nitrogen deposited from the air in excess may have harmful effects on living organisms, especially herbaceous plants and water systems. Excess nitrogen may also enable nonnative plant species to outcompete native plants.
Sulfur deposition onto soil, plants, and water can increase acidity in park ecosystems, leading to changes in water and soil chemistry that impact ecosystem condition.

Visibility is reduced when tiny particles in the air scatter and absorb light. High values for visibility supports viewshed integrity. This indicator measures how well and far park visitors can see.

Ozone (W126) is monitored and scored against a high ozone concentration threshold, which are conditions that most likely will affect vegetation. When ozone is too high, it can burn plant tissues and reduce overall plant survival.

## Landscape Dynamics monitoring and thresholds

Landscape Dynamics reference condition table

| Metric | Reference condition |  |  | Park average | Overall score (\%) | Condition |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Fragmentation by roads (km/km²) | $\frac{2}{0 \%}$ | $\begin{aligned} & \text { km/km² } \\ & \text { score } \end{aligned}$ | $\stackrel{1}{100}$ | 7.54 | 0\% | Very degraded |
| Impervious surface (\% area) |  | $\begin{aligned} & \text { \% area } \\ & \text { score } \end{aligned}$ | $\begin{array}{r} 10 \\ \quad 100 \% \end{array}$ | 6.44 | 100\% | Very good |
| Interior forest area (\% interior) | $\begin{aligned} & 0 \\ & 0 \% \end{aligned}$ | $\begin{aligned} & \text { \% interior } \\ & \text { score } \end{aligned}$ | $\begin{array}{r} 100 \\ \quad 100 \% \end{array}$ | 5.78 | 6\% | Very degradeed |
| Forest cover (\% cover) | $0$ | $\begin{aligned} & \text { \% cover } \\ & \text { score } \end{aligned}$ | $\begin{array}{r} 59 \\ \quad 100 \% \end{array}$ | 40.79 | 69\% | Good |
| Landscape Dynamic | veral | dition |  |  | 44\% | ( Moderate |

Fragmentation by roads decreases the quality of wildlife habitat, with high road densities fragmenting habitats and increasing the risk of wildlife mortality by collisions with vehicles.

Impervious surfaces negatively impact the condition of various ecological indicators, particularly stream invertebrates, due to increased stormwater runoff.

Interior forest area forms the core of a habitat, and increased interior area
improves forest condition.

Forest cover provides habitat, wildlife corridors, and ecological value important to park natural rescources and overall landscape condition.

| Acid neutralizing capacity ( $\mu \mathrm{eq} / \mathrm{L}$ ) | $\begin{aligned} & 20 \\ & 0 \% \end{aligned}$ | $\mu \mathrm{eq} / \mathrm{L}$ <br> score | $\begin{array}{r} 200 \\ \quad 100 \% \end{array}$ | 1,376 | 100\% | Very good |
| Water Quality overall condition |  |  |  |  | 69\% | Good |

Habitat is assessed using Physical Habitat Index indicators such as riffle quality, stream bank stability, and woody debris.

Benthic biota are scored based on the expected benthic faunal assemblage in an unimpaired site.

Total phosphorus is scored based on region-specific threshold categories.

Nitrate is scored based on region-specific threshold categories.

Dissolved oxygen in low concentrations
can cause metabolic impacts and death of fishes, invertebrates, and aquatic plants.

Biotic Integrity reference condition table

| Metric | Reference condition | Park average | Overall score (\%) | Condition |
| :---: | :---: | :---: | :---: | :---: |
| Fishes <br> (FIBI score) | $\begin{array}{llr} 1 & \text { FIBI score } & 5 \\ 0 \% & \text { score } & 100 \% \end{array}$ | 2.34 | 33\% | Degraded |
| Seedling stocking index (\% adequately stocked plots) | $\begin{array}{llr} 0 & \% \text { plots } & 66 \\ 0 \% & \text { score } & 100 \% \end{array}$ | 14.30 | 22\% | Degraded |
| Exotic herb density (\% plots with exotics) | $\begin{array}{llr} 100 & \text { \% plots } & 8.33 \\ 0 \% & \text { score } & 100 \% \end{array}$ | 61.70 | 54\% | Moderate |
| Birds (BCI score) | $\begin{array}{lcr} 20 & \text { BCI score } & 77 \\ 0 \% & \text { score } & 100 \% \end{array}$ | 46.00 | 38\% | Degraded |
| Deer density (density per sq acre) | $\begin{array}{lrr} 20 & \text { density per sq acre } & 8 \\ 0 \% & \text { score } & 100 \% \end{array}$ | 31.70 | 0\% | Very degraded |
| Pest species (\% plots infested) | $\begin{array}{lcr} 100 & \% \text { plots infested } & 0 \\ 0 \% & \text { score } & 100 \% \end{array}$ | 75.00 | 75\% | Good |
| Biotic Integrity overall | ondition |  | 35\% | (1) Degraded |

Fish are an important part of the ecosystem. The condition of fish communities reflects the condition of overall aquatic habitat.

Seedling stocking index is assessed based on the minimum needed native tree seedlings to maintain a selfsustaining forest when deer densities are high.
Exotic herb density, when high, harms ecological communities by crowding out native species and reducing native biodiversity.

Birds are assessed with the Bird Community Index, which uses several characteristics to assess bird communities as ecological indicators.

Deer density can severely impact forest growth and regeneration through browsing. At high densities, deer damage the overall condition of a park.

Pest species infest and damage trees; therefore, any observed presence of certain pest species, such as emerald ash borer, is unacceptable for this indicator.

## _ooking to the future

The Resource Assessment for Management Strategies provides a snapshot of natural resource conditions in individual parks, and places parks in a landscape context, allowing the assessment of conditions across the NCR. Understanding the value and relevance of park resources at a landscape level facilitates ecosystem-level management, benefiting the parks and neighboring lands. This allows for consideration of resources in a broader context when planning management actions by identifying resources that need improvement and highlighting gaps in data.

The RAMS interface is part of an ongoing NPS NCR-UMCES collaboration to assess and identify conservation needs for significant natural and cultural resources within the NCR parks.
